

SUPPLEMENTAL MATERIAL

FIGURES

Supporting Figure 1: Detailed network architecture for the MGMT-net. Our previously trained 3D IDH network was used. The left arm of the Dense U-net (striped red box) is the encoder part of the network, the right arm of the network (blue box) is the decoder part and the dense block (yellow box) is the bottleneck block. The encoder part of the network was frozen to retain the pre-trained weights from the 3D IDH network. The bottleneck block and the decoder part of the network was fine-tuned for a dual class segmentation with class 1& 2 representing methylated & unmethylated MGMT promoter status respectively.

ROC methodology

The network output classifies voxels in the tumor as methylated or unmethylated MGMT promoter type. The percent of methylated voxels was computed for the network output for each subject in the test set by dividing the predicted methylated voxels by the total number of predicted voxels in each tumor. The percent methylated voxels can be viewed as a network output prediction likelihood of the tumor being MGMT methylated. Note that in the manuscript, majority voting (the 50% threshold) was used to determine MGMT promoter status. For the ROC analysis, the percent of methylated voxels was sorted and used as separate thresholds (cut-points) to determine the MGMT promoter status for the subjects across the test set for each new cut-point. The resulting predicted MGMT promoter class membership was compared to the ground truth values to determine sensitivity (true positive rate) and 1- specificity (false positive rate) at each threshold. The resulting values were plotted using R to obtain an ROC curve (true positive rate against false positive rate). R routines were used to fit the curves and determine the area under the curve (AUC). This procedure was repeated for each of the 3 test folds from the cross-validation procedure for the MGMT-net, providing a total of 3 ROC curves from the cross-validation.

TABLES

Table 1: Subject wise MGMT promoter status and tumor histology

Subject ID	Age	Gender	Histology	Grade	TCGA Data Collection	IDH mutation Status	1p/19q co-deletion status	MGMT promoter status	Survival (months)	Karnofsky performance scores	Cross-validation group
